As the world is becoming increasingly digital, we are openly embracing the universality of data in every device or technology we use. I have always been fascinated by this omnipresence of data reaching into our lives and when I was introduced to computers teenager, I found myself mesmerized by the world of data and computer. In past 2 years, I spent hours on my PC going deep and learing more about this field and want to pursuing data science as my career.

I opted Computer Science(Python) in class 11th and 12th. It eventually beacame clear to me that i want dive into the world of maths and computers. I learnt so many things during the course of these two years like Python, Web devlopement, 3 d desinging. And also I learnt how data science is making a mark for itself in every possible field there is including business, communication and health. So the more I studied, the more I wanted to explore and learn. And this enthusiasm is what brought me to apply for BSc in Data Science.

What drove me towards pursuing Data Science is my curiosity to know more about the fields that I just touched upon. I have built a basic foundation for myself in these 2 years but now I wish to take it further and claim complete proficiency in the field. So, before entering the professional world I wish to learn all that I could on the academic front.

And I believe that for this, acquiring BSc in Data Science would be a step in the right direction. This is exactly what probed me to pursue a Bachelor in Data Science and I believe that this will be the stepping stone towards the heights that I wish to reach in the field of Data Science.
